Reline with flexible stainless steel liner kits.

When considering the relining of a chimney, one option would be to use a flexible stainless liner. Like the cast in place system, the stainless liner comes with a lifetime warranty. However, creosote buildup in stainless liners should be inspected yearly. The stainless liner is constructed of the finest certified 304-alloy stainless steel on the market, featuring four interlocking layers (see diagram 1.1)

diagram 1.1

Flexible Stainless Steel Liner Kits

The flexible stainless steel liner installation process.

First, we lay down clean drop cloths and seal off the entire firebox area to protect the inside of the house.

Next, if the pipe cannot be placed inside the existing liner, we remove the existing liner with the use of a tile breaker.

After, the old liner is removed, we then carefully begin to install the flexible stainless liner.

The liner is pushed down through the chimney all the way to the firebox area.

If the old liner has to be removed as mentioned above, we then pump mix between the stainless liner and the chimney.
